

case, try to avoid patterns or things that are commonly guessed. Use special characters and numbers to increase your security.

- The third type is transactional login, that constitutes of your financial data. This one consists of extremely vital information that needs to be protected with a super-secure password. Use capital letters, special characters, and numbers to create a fairly lengthy password that cannot be cracked anyhow because a breach of financial data can lead to an irrecoverable loss.

This way, you just have to keep a record of three unique passwords that keep your digital existence from getting way too haphazard.

Get “randomly” unique!

Here is an interesting way to create a strong password that will be easy to remember and cannot be cracked easily. Open to a random page on the internet and choose an unusual or quirky word that will stick in mind. Then add the paragraph number, word number, number of letters to it, and have a unique password for everything. The question is how not to forget it. The answer is simple. Bookmark the page and save it in the name of the site for which you are using the credential. It acts as a hint and doesn't make it too obvious for other people.

Use your favourites!

Create a unique password with your favourite song, book, and series names. It is not as obvious as it sounds. Pick out a certain lyric from the song that has touched you the most and create your password with that. Use alternate caps lock to make it stronger. Do the same for the book and use the page number as a hint that will help you at the time of logging in. Choose a dialogue from your favourite series and use that as a password by adding the initials of the character at the end who has said it.

Form words with special characters

Special characters are more useful than we think. They can be used between letters in a word without altering the meanings. For instance, “You h@v€ @ \$tR@Ng€ M!nd”. It is noticeable that the sentence, in spite of using special characters, makes perfect sense, but the special characters make the password stronger and more unique. Occasionally, numbers can also be used in between for the same purpose. In this way, even a simple sentence or name can be used as a password that can be remembered easily.
