

out the existing version of the firmware of your router via making use of the router's dashboard effectively.

- **Procedure 7: Make use of guest network:**

In case your router has the broadcasting option which is known as a guest network, then you can make use of it. The guest network is nothing but giving access to your close ones for your Wi-Fi connection, without allowing them to access the whole network. Hence this is the added advantage for you to keep your network very much secure and safe.

The router you are using must have the option to hide your SSID. The network name will not appear when any devices are scanning for the Wi-Fi. You are able to add your preferred devices via the guest network.

### **Connecting through the secured Wi-Fi:**

In conclusion, the MAC Address filtering along with the WPA2 (AES) encryption is mainly considered to be the most effective process to secure your Wi-Fi connection from attackers. If you have done all the processes mentioned above perfectly, then no one can access your internet without your knowledge.
