

systems, there's an initial phase called POST (power-on self start.) When your system is showing you the POST screen, you can click on the hotkey before the POST completes and starts loading your OS.

If you are successful, you will have your BIOS setting up on your screen in no time. If you are running Windows 10, you can follow these steps.

Getting to BIOS using Windows 10

Setting > Update & Security > Select Recovery

Here on Recovery, as you can see, there's an option for Advanced startup, under which there is a Restart now button. Click on that button, and your system will start a reboot process.

After your system reboots, you will be asked to choose options, here click on troubleshoot.

Select advanced options and choose UEFI Firmware settings and click on the Restart button.

Now our last method is for Linux lovers, and you can use this command to restart your computer and get to the BIOS setting. `sudo systemctl reboot --firmware`.

How can you update your computer's BIOS?

Before you shut down your system and restart it on
