

In this article, we'll talk about several tips to free up the storage space of a personal computer.

Emptying the Recycle Bin

Recycle Bin in computers is used to store deleted data from the system. This folder temporarily stores files and folders before they are permanently deleted. Files are sent to the Recycle Bin so that they can be restored if required. Over time, even the recycle bin can get "full". This can cause storage problems for the system. If the files are of no use, it's better to delete them permanently.

To empty the recycle bin, follow the steps given below:

1. Click Start.
2. Type Recycle Bin and select the option to open the folder. Alternatively, you might have a shortcut to the Recycle Bin on the desktop itself.
3. Select the Recycle Bin Tools tab.
4. Click the Empty Recycle Bin button.
5. Click the Yes button.

Note: You can also select all the files and folders in the Recycle Bin folder and press Delete.

Removing junk files

The junk from system files can easily be deleted from computers using the Storage Sense feature. Additionally, installation files which are usually temporary files, can also be deleted which will result in more free space resulting in better drive efficiency.

Remove junk using Storage Sense

To remove junk files using Storage Sense, follow the steps given below:

1. Open Settings.
2. Click on System and then on Storage.
3. In the Storage section, click the Configure Storage Sense or run it now option.
4. Search for the Temporary Files section, under it check for the Delete temporary files that apps aren't using option.
5. Select the Recycle Bin drop-down menu to specify how to clear deleted files and folders.
6. Select the Downloads drop-down menu to specify how to clean the files and folders that have been downloaded from the internet.
