

Remove malware from your PC

If you encounter a sudden performance slowdown in your PC, then most likely it's due to a malware attack.

What is malware?

Malware is a type of malicious software written with intent to damage a system or to steal data. For monetary benefit, hackers often create malware and spread it, either by themselves or by selling it to the highest bidder. However, some ethical hackers create malware to test the security structure of companies as well.

Types of malware include – viruses, Trojans, spyware, worms, ransomware, adware, and botnets. Malware often strikes through email, software downloads, and ads. These malware can do large-scale damage to your system. Few malware can even go undetected for long periods of time, slowly corrupting and stealing your data.

How to remove malware/s?

Basic antivirus software does not have the potential to detect or eradicate malicious malware or zero attacks. We recommend you to use premium internet security apps like Norton 360, Bitdefender or McAfee. Also, Exclusive malware removal apps like Malwarebytes, anti-rootkit, SpyBot Search and Destroy, etc. works best in removing tough malware besides offering real-time protection to your PC or laptop.

Once you install an antimalware app, simply run a full system scan. The app will do the rest.

Uninstall unwanted software

With years of usage, we keep installing and updating new software without realising how adversely these software can affect our system.

Why remove old and unwanted software?

Even though you may not use most software on your PC, it will not stop them from drawing memory from your PC. Many software remain active in the background, which may eventually make your PC too slow to operate.

Try the Performance troubleshooter

The performance troubleshooter tool helps you automatically find and fix issues within your system. The tool runs a background check of your whole
