

as you turn on your system. However, opening a bunch of applications on startup often slows down your system. There might be a chance that you may even have forgotten about apps you installed in the past but don't use them anymore.

To disable startup applications, go to the task manager, click on the startup tab. Then disable the applications you don't want launching every time you boot up your system.

Install additional RAM

Additional RAM can dramatically improve your PC's performance, especially if you use multiple applications at the same time, such as video editing software, or games. For 32-bit Windows, you should have at least 2 GB of RAM. Meanwhile, if you use a 64-bit version, then use at least 4GB of RAM. It's even better to upgrade your RAM to 8GB or 16GB for better performance.

Upgrade your Hard Disk

Using multiple applications simultaneously means the creation of more temporary files. To accommodate more files, you need a faster and spacious hard disk. If you need less storage, then go for an SSD as they're faster. However, you can always go for higher storage hard disks in accordance to your requirements.
