

Get an idea of the items you have

Before you actually start organising the music and video library, you should first do some thinking as to how you wish to do the organization. The simplest way would be- Artist>Album>Year of release>Song.

However, this does not give much structure to your library, and it will remain quite cluttered. When it comes to video albums, the confusion will increase because the same music will have a live performance and a video release. If you have both of these on your computer, then you will have to save these under different audio files. Thus, the confusion will increase because the artist and the song will remain the same. Hence, while organizing your music and video library consider doing the following activities first:

- Select a top-level Music folder from your Windows Media Library
- Convert all the artwork, i.e. the Cover Artworks into JPEG files
- Check the formats of the musical tracks.
- Check the formats of the video tracks.
- Consider storing the artworks in separate folders.

When you check the structure of the windows media library, you will find various dropdown menus allowing you to create multiple folders. You can name the folders as per your choice. Understanding the folder structure is essential because, after that, you can place the audio and videos of your choice in particular folders. This will make it easier for you to access a specific musical album or video whenever you want. The library can also be uploaded onto an online server to make it easier for you to access the same from mobile devices.

Saving the audio files

First, get an overview of the audio and video files that you have of a particular artist. You will have to organise these in alphabetical order. While saving audio, save as Artist>Album>Date of Release>Track. Now, there are certain factors that you should take into consideration while saving the audio files, and these are as follows:

- Check the extensions of the Audio files.
- Audio files can be compressed as:
 - Free Lossless Audio Codec (FLAC)
 - Apple Lossless Audio Codec (ALAC)
 - Direct Stream Digital (DSD)
- In case of compressed files, you will have to split the folders.
