

Saving the video files

When it comes to saving the video files, the first thing that you must take into consideration is whether these are music videos or movies. If these are movies, then create an entirely different library, preferably. If you are planning to save it under the same library, then make a separate folder as Movie>Name>Date of Release. If it is a lyric video then you will have to save it under Artist>Album>Date of Release>Video. While saving video albums, there are certain factors that you must take into consideration, and some of these are as follows:

- Check the date of release of the video.
- Sometimes video albums are re-released and hence, the date of album changes.
- If you want to save both albums, then you will have to bookmark the albums accordingly. This will make it easier for you to access both in future.
- You should be able to associate the artwork with the video album. This can be done by associating the album with the artwork.
- The album consists of all the individual tracks, and the album is associated with the artwork.
- So when you play a particular track, your computer screen will display the album, the individual tracks and the associated artwork.

Thus, saving the video files separately under the same or associated folders can prove to be helpful, if you want to play individual tracks or the entire album. If you play the whole album, then all the tracks will play one after another continuously, and you will not have to monitor it.

Deduplicating files

When you organize your video and audio library, it is essential that you deduplicate the entire library. There are three main benefits that you will get by deduplication, viz. data reduction, single-instance storage and intelligent compressor. Moreover, the chances of losing data will also be reduced. When you deduplicate files, you are reducing the storage space and clearing up the space. Audio and video files usually take up a lot of space, whether you are storing these in the internal memory of your computer or on an external hard disk. Hence, it is essential that you de-duplicate the files to reduce the storage space.

Renaming files and folders in bulk

Sometimes, after your audio and video library has been developed, you
