

users to download. However, Windows, having been developed by Microsoft with the commercial aspect in mind, is quite expensive.

- **Open Source and Closed Source:** While Ubuntu continues to be an open-source, meaning that its source code is available for free on the Internet, Windows is a closed-source operating system. Its source code is not available for the common masses to modify and to use.

Windows 10 v/s Ubuntu

- **Hardware Compatibility:** Windows is said to be an OS with maximum hardware compatibility. Although this bore some truth for the older versions of Windows, it is no longer applicable for the latest versions which often forces its users to upgrade their hardware. Ubuntu, on the other hand, follows the principle that Linux was made initially with - hardware compatibility should always be preserved. So, any hardware that used to work for the previous versions of Ubuntu will work for all the latest versions as well.
- **Software Compatibility:** Windows being the most widely used operating system in the world, has many more applications that are supported on the network. There are many games and related software that are available only for Windows, and will either rarely work, or not work at all on Ubuntu. However, the alternatives to these applications are available for Ubuntu. Here, one significant advantage that Ubuntu has over Windows is that the applications for Ubuntu are free. They can be downloaded and used without any surcharges. However, most of the applications that run on Windows are expensive and are required to be bought by the User.
