

Installing Ubuntu as a dual-boot operating system

Many computers, especially laptops, have a dual-boot system where a user can run more than one OS. Ubuntu and Windows are two unique operating systems, and a user can use both with these dual-boot computers.

1. **Creating a disk or a live USB:** Download the live disk or DVD. One can also download the live USB tool instead.
2. **Boot the downloaded disk or USB:** Begin with plugging in the USB or the disk and restart the computer. While the computer is restarting, go to the boot menu and choose to boot from the removable disk or live USB.
3. **Installation:** It takes some time to boot the system, but once it has been done, the User is given two options- to trial run Ubuntu or to directly install Ubuntu. It is the user's discretion to choose the required setup.
4. **Preparation of the partitions:** Since most users already have Windows installed, it is essential to create a different partition for Ubuntu.
5. **Following the instructions given:** Once the root, swap, and home are created, users will be given a series of guidelines to follow. Executing these instructions will take care of the final setup procedures.

The command-line interface or CLI

The command-line interface or CLI is the opposite of a graphical user interface or GUI. While the latter is more about graphically representing an instruction, the former is text-based. A user is required to type in the commands on the CLI, and the kernel successfully executes it.

```

melalx1000@grml: bash
GNU nano 2.2.6 File: myscript.sh

read color

clear
echo "$color is a good color"
echo "Now Saving that Info"
echo "$name favorite color is $color." >> color.log

echo "Data saved."
echo "Please Press Enter to Continue"
read

clear
echo "Have a Good Day $name"
