

Without GUI

The experience is not entirely bitter for a person working without a GUI. GUIs take up more space and thus adds more work for your processor. So if you are running large programs, you can try a terminal option which works fast on weaker machines as well. Command in line is much lighter and thus increases the speed of the computer. It is possible to web browse without GUI. Similarly, there are other possibilities like word-processing, presentation, instant messaging, email, music, spreadsheet and file management without GUI. It is entirely possible to live without GUI in the year 2020.

For example, cmus is the music player in the command in the line. You can also stream videos in the terminals. The following is the input format of a presentation:

```

• ---
• title: This is my presentation
• author: Jane Doe
• ...
• # This is a slide
• Slide contents. Yay.
• ---
• # Important title
• Things I like:
• - Markdown
• - Haskell
• - Pandoc
• You can set margins to your document in the following way
• ---
• title: Presentation with margins
• author: John Doe
• patat:
•     wrap: true
•     margins:
•         left: 10
•         right: 10
• ...
• Lorem ipsum dolor sit amet, ...
• Or auto-advancing in
• ---
• title: Auto-advance, yes, please
• author: John Doe
• patat:

```
