

Input And Output

Let's look into the Primary Keywords:
Standard Input, Output, Error

All the commands can produce output or take input directly from the keyboard. In Linux, it is also possible to send the output to a document or read input from any document. Every shell command in Linux has its defined input and output, and before the execution, said input and output are redirected with a special notation. This is interpreted with a shell where changing its default path is called redirecting.

Standard input, output, and error

Standard output- The shell in the Linux-based operating systems constantly watch the output place, and whenever it detects any new output, it directly
