Permissions

Understand the role of permissions and file ownership in command line

Introduction

For many Linux users, file permissions and ownership can be difficult to get used to. It is usually hypothesised that a command line is required to accomplish what you desire from the file system. The good news is there are other methods for dealing with the file system which offer greater strength and flexibility, that many people are unaware of. The easiest desktop interface eliminates the need for command-line usage even if you have to deal with the file folder ownership and permissions. Files and folders can actually be managed from the file manager. However, it is always better to understand what you are doing before accessing the graphic user interface.

The sudo command

The sudo command is the short form of 'superuser do'. It grants the required
