

Pasting

To paste, move the cursor to the required position and hit “p” to paste the text after the cursor or “P” to put the text before the cursor.

Searching within a file on Vi Text Editor

To search within a file, you need to be in the Command Mode. Type “/” followed by the string which you want to search in that particular file. After this, you have to hit <enter>. This will lead you to the first occurrence of the word in the file. Then you can hit “n” to find the next occurrence or “N” to go back to the previous occurrence.

Searching and replacing in Vi Text Editor

If you want to search a certain word and replace it with another one, then you need to activate this particular command in the Command Mode.

`<:s/(the word you want to search)/(the word you want to replace with)/`

For example, if you want to replace “soft” with the word “hard”, then the command for this goes like this, `<:s/soft/hard/>`

If you want to replace all occurrences of the word, then you need to follow it up with a “g”. `<:s/soft/hard/g>`

Editing multiple files and switching between them

You have to use ex commands for carrying out this task. The command for this goes as follows. For invoking multiple files,

`vi <name_of_file1> <name_of_file2>`

For example, `vi power play`

This command will open 2 files, “power” and “play”, in the particular order. You have to do the edits in the text file “power” and save it with `<:w>` and move to the next file with `<:n>` and do the edits and save it with `<:x>`. Just keep this in mind that when you switch between two files, make sure that you go to the Command Mode to execute the command. Besides, if you want to insert another text file while editing the above two lines, you can also do that with the following command. First, save the files with `<:w>` and then open other files with

`<:e (filename)>`

For example, if you want to open another text file when editing the files “power” and “play”, you can insert another text file by opening it with

`<:e button>.`

This will open the file “button” and you can continue your edit by switching between the files. **d**
