

<code>\${parameter,}</code>	Expand value of the parameter changing only the first character to lowercase.
<code>\${parameter^^}</code>	Expand the value of the parameter into all uppercase letters.
<code>\${parameter^}</code>	Expand value of parameter changing only the first character to uppercase

Here is a simple script for this fact:

- `#!/bin/bash`
- `# ul-param - demonstrate case conversion via parameter expansion`
- `if [[ $1 ]]; then`
- `echo ${1,,}`
- `echo ${1,}`
- `echo ${1^^}`
- `echo ${1^}`
- `fi`
- And the result will be.
- `[me@linuxbox ~]$ ul-param aBc`
- `abc aBc ABC ABc`

Arithmetic Evaluation and Expression

The basic form for arithmetic expression is: `$ ( (expression) )`. Here, expression presents a valid arithmetic expression.

Number Bases

Shell offers support for all integer constants in any base. Here are different ways numbers can be represented.

NOTATION	DESCRIPTION
Number	Numbers without any notation are treated as decimal (base 10) integers.
0number	Numbers with a leading zero are considered octal.
0xnumber	Hexadecimal numbers
base#number	Number is in base
