

>>	Right bitwise shift. Shift all the bits in a number to its right.
&	Bitwise AND. Performs an AND operation on all the bits in two numbers.
	Bitwise OR. Performs an OR operation on all the bits in two numbers.
^	Bitwise XOR. Performs an exclusive OR operation on all the bits in two numbers

You can use all these operators in combination (for instance <<=) other than bitwise negation. Here is a quick presentation that gives power of 2 results using a left bitwise shift operator:

- `[me@linuxbox ~]$ for ((i=0;i<8;++i)); do echo $((1<<i)); done`
- 1 2 4 8 16 32 64 128 (all on separate lines)

Logic

Various logic comparison operators are supported to get specific results.

OPERATOR	DESCRIPTION
<=	Less than or equal to
>=	Greater than or equal to
<	Less than
>	Greater than
==	Equal to
!=	Not equal to
&&	Logical AND
	Logical OR

These operations generally follow the rules of arithmetic logic. So expression with evaluation as zero is presented as false while all other non-zero expressions are presented as true. Here is a simple demonstration of this rule:

- `[me@linuxbox ~]$ if ((1)); then echo "true"; else echo "false"; fi`
- true
- `[me@linuxbox ~]$ if ((0)); then echo "true"; else echo`
