

3) Android

The brainchild of the biggest company in the world – Google, Android has definitely set some important benchmarks in the industry. The product has been on high demand ever since it was released, primarily from after the release of Android Ice Cream Sandwich. Needless to say, Google has been stuffing every new version of Android with features. However, they never needed to add more than a few ways to take a screenshot, simply because theirs is the easiest method of all operating systems.

- **Power button and volume down:** The popularity of Android can be judged clearly by this method itself. This is already a standard methodology and being a tech-savvy individual; we are sure you are aware of this. Pressing the power button together with the volume down can be pressed to take a screenshot on your Android phone. This feature is available from Android Ice Cream Sandwich onwards.
- **Three-finger swipe:** This is a feature that was discovered only recently. Taking a screenshot has never been easier, and it is because of this feature alone. Android allows you to simply swipe down the screen with three fingers to take a screenshot. If you didn't know this already, it would be all the more fun to try it out now!

4) iOS

Just like Android has made a place for itself in the market, and in the pockets of the common man, the iOS too is regarded as one of the most used operating systems on a handheld device. Needless to say, they also have been changing the way their phones work, releasing feature-stuffed models every year. Apple has three methods to take a screenshot, one for each kind of device that supports the action.

They are as follows:

- **Side button and volume up:** For the iPhone models that have a side button, you have to press that and the volume up button together to take a screenshot.
