

Though the procedure for connecting the PS4/ Xbox One or any wireless controllers with your iOS or Android phone requires least effort, the details of the whole set-up vary depending on the controller you want to connect to and the version of the operating software to which you want to pair your controller with. So, let's get started with the first step towards establishing a successful connection, of pairing the controller and your smartphone.

Put your PS4/ Xbox One controller into Pairing Mode

If you use the Xbox One controller and want to pair the same with either phone, first make sure that your controller's Bluetooth is ready. To check this, you just have to look at the controller to see if there is a glossy plastic cover over the Xbox button of your gamepad – the Bluetooth will not work if that's the case. But, if the Xbox button has the same matte plastic which the face of the controller has been made from – the Bluetooth shall easily connect.

Now, to put the controller into pairing mode, you have to hold down the Xbox button that is present in the middle to turn on the controller. As soon as the lights are on, you are required to click and hold the 'connect' button present at the head of the controller (near the bumpers) for a few seconds, till the light on the Xbox logo blinks, which indicates that the controller is ready to pair.

Irrespective of the type of device you pair with the PS DualShock 4 controller, your controller should be set into pairing mode first. And, to put it into the pairing mode, you just have to press and hold its 'SHARE' button, to the left of the touchpad, while holding the middle 'PlayStation' button.
