

can recognize the controllers way faster than the earlier versions of the software. The smartphone users who have Android 10 and want to connect either controller with their Android phone get entitled to a bonus. This bonus is that if they feel like not using the analogue stick to navigate while playing, they have the privilege to use the controller's touchpad (only with the DualShock 4) as a mouse pointer for the software and in-game as well.

- If your operating software version is Android 10, you have to first make your way to the “Settings” application and click the “Connected Devices” option. If your PS4/ Xbox One controllers are ready for pairing at this moment, you will find your controller under “Pair New Devices” list

where the DualShock 4 controller will show as “Wireless Controller” and Xbox One controller will appear as “Xbox Wireless Controller.”

- Once you have located your controller on the list, tap on the name to select it. If your PS4 Bluetooth controller is connected to your Android phone that has Android 10 as OS, the light bar on the controller will turn into blue colour, signalling that the set-up or connection has been made successfully. In case you have connected the Xbox Bluetooth controller with Android 10 OS phone, the controller's backlit middle button will remain lit up throughout the time that it is connected to your phone.
- However, if your Android phone has an older software version, like Android 7 Nougat or Android Oreo, you have to start by opening the “Bluetooth” option from your Android phone's “Settings” application. Click on the “Bluetooth” toggle to turn it on, and search under the “Pair
