

has the capability to tamper with the information stored in the email archive. This means that no employee can add or remove emails from the email archive.

The archive is set in stone and acts as an essential base of knowledge and information regarding the company and its transactions. The communicative actions of all employees are logged in the email archive and may be accessed by senior management.

- **Search Capabilities**

Most email archiving systems contain premier search capabilities that allow users to search through the archive efficiently. Email archiving systems contain a host of different filters to choose from, including the date range of sending or receiving the email, the sender, recipient, tags, and more.

This allows the user to pinpoint the exact email he/she is looking for, and saves search time, increasing search efficiency. This quickly translates to end-user productivity, further increasing the productivity of the firm as a whole. High-end search capabilities are among the most coveted features of any email archiving solution.

- **Improved Performance of Server**

As aforementioned, the current server on which the email is hosted requires high-end technology, past performance, and premier storage capabilities. These features are necessary for better productivity of any user or firm and are also very costly.

As the capacity of the server is fulfilled, the performance of the server drops exponentially. If the part of the server occupied by emails is partly archived and transferred to an alternative, low-end server, the current server is able to showcase better performance and improved capabilities. It is hence prudent to use two different servers for email hosting and archive storage.

- **Unified Communication Repository**

The email archive acts as a unified repository of all the communication made by the employees of a company. It is easy to search, manoeuvre and analyze the archive when it is hosted in a unified repository. Emails and archives hosted on different machines and servers can often cause a problem in analysis for the management and legal teams.

Being hosted on a unified server allows the management to holistically look at the status of the company and even individual departments, allowing
