

- Step 5: Voila! You have set your windows default theme to Dark. You can choose a contrasting light accent colour, which complements the dark mode. We don't recommend dark colours like grey or edgy colours like red.

Switching on the dark mode in macOS

Like Microsoft Windows, Apple Mac OS has released their dark mode in the fall of 2018. It rolled out with Mac OS Mojave (10.14). Previous versions like Mac OS or OS X, such as Sierra or High Sierra, cannot enable the dark mode on their laptops, although they can enable dark dock as well as a dark menu bar. You can easily enable or disable the dark mode on Mac OS via the Mac System Preferences.

- Step 1: Launch System Preferences by navigating to the Apple menu, which can be found on the top left of the screen.
- Step 2: Select the General panel and click the Appearance option. Choose the dark option to enable the dark mode.
- Step 3: While you are done setting up the dark mode on your Mac OS, you can also select the Auto option to automatically switch between the Dark as well as the Light mode as a day progresses. This is optional. Once you select your dark mode, all the apps and file managers will shift their colours accordingly and enable the dark mode on the same. You can also enable dark mode on the dock as well as the menu bar on Mac Sierra and High Sierra.
