

Switching on the dark mode in Android

In Android OS, dark mode is popularly termed “dark theme,” which is their dark themed display launched system-wide in Android 10. There is more than one way to enable this mode in your latest Android phone:

- Step 1: Navigate to the settings application on your phone
- Step 2: Open the “Display” menu and toggle “Dark Theme.” And you’re done!

It is as simple as that! Alternatively, you can do a few other things. You could swipe down the navbar screen and unveil the Quick Settings, and you can find an option to click on the same. Other than this, drag the quick settings gear icon and open the same. Once you spot the dark theme settings, drag it open and dark theme should be enabled across your android device, including many of the Google native apps.

Assuming you have a phone that doesn’t support the latest version of Android, Android 10, then it may differ for you in settings. Although a dark mode may be available on your phone, it may differ from enabling dark mode across all the apps inside your phone. There could be a bunch of limitations on the same.

To activate Android’s Dark Mode in non-Android 10 phones, you can do the following:

- Step 1: Navigate to the Settings in your phone and click on “Display.”
- Step 2: Next, go to the “Advanced” Section on your Display and activate the setting that says “Dark Setting.”

Assuming you have an Android 9 Phone, you can enable Dark Mode as well, although it can be tricky and not as seamless as it is on native Android 10 phones. To do this, you must go to the developer options, which can be unlocked by clicking the Build number multiple times (5 times).

To do this,

- Step 1: Go to the developer options. First go to your settings, tap on “About Phone,” scroll to the “Build Number” and tap it 5 times repeatedly. You will notice that your developer options have been unlocked.
- Step 2: The developer options can be found in Settings > System > Advanced > Developer Options.
- Step Three: As you scroll, you will find “Night Mode,” which can be activated and set to “Always On” or “Automatic” to activate the dark mode.

If you prefer a quicker solution and slightly different from the above, you can find different launchers such as Nova Launcher, which lets you customize the Android Phone interface, and enable the dark mode on your phone.
