

the left and the right are housed in a single component which is your soundbar then it is better to place it just below your screen.

4. One thing you should keep in mind is to place the speakers as far away from each other as possible to get the sound from different angles. It will create a virtual sound even without turning on the surround sound.

5.1 Channel

1. Now, here you need to do some extra work, but it will all be worth it. Once you take out all of the speakers, start mapping your room where you need to put these five speakers and one subwoofer. The best way to get the highest sound quality and surround sound experience is by placing one in the centre in front of you and two at the far side of your room in front of you. The remaining two that will work as a surround channel needs to be placed behind your sitting area.
2. The surround channel speakers need to be placed above your neck height. In addition to this, if you can mount them at an angle of 120 degrees on both sides, it will work perfectly.
3. After that, put your sub in front of you on the right of your screen where you can easily control it even manually if you need it.
4. The fun part begins when you complete the installation, and you are ready for the calibration process. Here it's a bit different – either you can go for automatic calibration which the system will do on its own. Or, you can fine-tune it according to your liking.
5. Now, one by one, test the volume of each speaker and tweak the setting until all five have the same volume level. The most commonly used volume level is 75db.
6. If you want to make sure that not only do you enjoy the great audio but the people sitting with watching the movie get the same kind of experience, then we suggest you should buy a microphone and test it in several locations. Check the reading of each speaker on it.
