

Human beings these days are surrounded by gadgets and electronic devices. These devices have become one of the most essential parts of our day-to-day life. We are living in a technologically-fueled reality where no one can live without gadgets, whether it is a mobile phone, a laptop, or video games.

Memory space in our devices is increasing day-by-day. Still, carrying an external memory storage device is beneficial. You can store all your extra data here without filling up the vital memory in your devices. The best part of the external devices is that they are functional as well as portable, owing to the small form factors of these storage devices these days.

The most-used memory devices are:

- Hard Disk Drive
- Solid State Drive

Nowadays, the most people aren't just content with the memory of their laptops or PCs, they also have an external HDD or SSD to go along. The Hard Disk Drive and the Solid State Drive have maximum longevity of three to five years. This time is extremely short for someone who wants to store important data reliably.

Nevertheless, it is also agreed that every electronic device comes with its own expiration date. Some die out suddenly without much prior warning, while some start displaying telling signs that you should pay attention to. The lucky users will actually be able to spot quite a few signs before their HDD and SSD finally dies out.

However, what if the drive suddenly dies out and all the data you have stored in the drive is lost forever? To avoid that let's talk about how you can understand the signs to know when your HDD or SSD is close to giving out. The methods discussed below are also applicable only if the drives start deteriorating gradually and not suddenly. No software or process can identify the sudden failure of drives because it only gets identified when the drive actually fails.

How to know when my Hard Disk Drive is dying?

A Hard Disk drive is one of the most commonly-used devices to store data.

The primary reasons why HDDs are used extensively are:

- They are easily available in stores.
- They are cheaper in comparison to other storage devices.
- Very portable, so data can easily be shifted from one system to another without any issue
