

- Now, modify the camera to movie mode.
- Select 'EOS Webcam Utility Beta' to use your upgraded webcam in video conferencing applications like Zoom, Microsoft Teams, Skype, or Google Meet.

Also, make sure that your Canon DSLR version matches the list of versions.

Unfortunately, most of the DSLRs don't have this flexibility, and therefore, you must be aware of the alternatives.

Using A Webcam App For Windows

Apps have made our lives convenient in many ways. They continue to do so in this situation too. Luckily, there is a software called 'SparkoCam' for PCs. If you're not sure about the software or want to test it before investing in it, this webcam application offers a free trial, but it puts a watermark over the visual.

Minimum System Requirement For Sparkocam -

- Operating System - Windows 7 or higher and Vista (Not for Mac).
- Display - 1024 x 768.
- RAM - 4 GB or Higher.
- Processor - Intel Pentium 2.0 GHz or equivalent AMD or Higher.

About SparkoCam -

- The cost is \$70 for the standard version, which is compatible with DSLRs brands such as Canon and Nikon.
- After connecting the DSLR with your computer using a standard USB, you will have the option to modify exposure and alter different settings from the software itself.
- It is important to note that recording audio directly from the DSLR won't be possible. Therefore, you will have to use the computer's in-built microphone (if it's available), or you will have to buy an external microphone so that you can speak in the video conference.

Note: A few users have reported that SparkoCam works best when used with modern cameras. With the older versions of cameras, it gives distorted visuals, so unless your DSLR is a new edition, this alternative might not be the most reliable one. Also, SparkoCam is strictly for Windows users and not for Mac.

So what's the alternative for Mac users?
