

Frame

It is essential to take care of the frame. You don't want your video calls to just show your face, where even the slightest of movement can place you out of the frame. But, why does this not happen in webcams? The reason is that webcams have wide-angle lenses, which makes it convenient to cover larger frames, making it easier for you to stay in the frame.

You will need to use the widest lens in your camera to get the best result.

Other important things to keep in mind -

- Your DSLR is equipped with automatic face detection. It is a good option that you must turn on while using your DSLR-cum-webcam. This will allow you to move a little, for example, shaking your head or other small movements while making sure that the focus is still on you.
- Since constant use of the camera during the video call will put a load on the system. It is advisable to keep it switched off when you don't need it, to avoid any strain on the hardware. Constantly switching it on has also shown overheating and DSLRs to shut down on their own. Therefore, make sure not to overheat and give it the proper time to cool down so that your webcam can function efficiently.

Summary

It might need a little extra effort to turn your DSLR into your webcam, but once you see the results, you will realize that the hard work paid off. Plus, when you know your video quality is as good as it can get and won't have any issues of blurred image or disconnection, you can confidently focus on the meeting.

We must understand that the pandemic is not going away anytime sooner. Therefore, being the smartest creatures on earth, we must learn to adapt to the new challenges and changes. The video conference is the new-age solution, and we must learn how to make the best of it. With a few types of equipment, a little bit of work, and smart planning, you can turn your home into an office and have meetings or attend virtual classes like a pro! **d**
