

- **Step - 2:** Now, once you open up Fraps, you will be welcomed by this UI, as the image above shows. It might not have aged well with time and still looks like 2015, but you don't have to worry about it.
- **Step - 3:** Click on Movies and you will enter the settings of recording, where you will see multiple configurations, and you can adjust them as per your recording style.
- **Step - 4:** You also need to mention where you want to save your recordings. By default, they will be saved in your Windows disk in the folder named Fraps, but you can change it according to your liking.
- **Step - 5:** Choose the settings such as per how many FPS you want in recording, from where the software will take external sound, etc.
- **Step - 6:** A hotkey is a must, and you need to figure out a key that is accessible to you when you are playing a game. Meaning: You can click that key even if you are playing your game; without interrupting your session. With a single press of a Hotkey, you can start the recording.
- **Step - 7:** Now, save the settings and open your game. Once you are in the game, press the Hotkey button you have selected to start the recording. Until you press it again, the software will keep on recording it. To stop the recording, you need to press the Hotkey, and the recording will stop.
- **Step - 8:** Now, go to the folder where you asked Fraps to save up your video and check to see if the gameplay and the commentary are recorded properly.
