

Some Tips from Great Developers

Below are some inspirational stories from some of the best developers:

- As per Christopher Chateau, who worked for five years with Facebook as a Front-end Engineer, there are multiple levels to be a better developer. The first level is to be an expert in all the concepts. For this, you need to practice code as much as you can. Practising similar code will make you proficient and train your muscle memory. The second level is to develop things such that they work well in the future and need minimal maintenance. The third level is to prevent the problem from occurring right from the start of the project. This can be done by understanding the problem well and looking at all the possible risks or issues that can arise.
- Ronan O’Rolang, who is the vice-president of Globoforce, said a great passion for problem-solving is excellent quality for a top-notch developer. Further, he said that practising is necessary. Developers can pick problems related to their hobbies and solve them in the language of their choice.
- Zendesk Developer shared his view and said that while developing skills, always start with a simple problem. Once you solve the simple problem, then add the edge cases. Once the correct results are found for the problem, optimise the solution. According to him, the goal should be “make it work, make it correct, and make it fast”.
- According to a Microsoft Developer, it is essential to keep learning new technology, languages, and staying up-to-date. To be a better developer, one should seek feedback for his/her written code. Developers should be open to learn new languages and stay updated with all new technological developments. They should have the habit of documentation so that a new person can understand the codes without any difficulty. He further suggests learning a specific scripting language.
- Dr Peter Schachte, who is a lecturer at the University of Melbourne, suggests that a developer should be organized and patient. A developer should make a habit of reading code written by other developers that helps them in understanding the different ways to solve a problem and ultimately write efficient code. Writing modularised code is another skill of a good developer that makes your code organized. He further says that a developer should learn multiple languages to be a top-notch developer. According to him, once a developer becomes comfortable with a programming language, they should focus on learning
