

different languages. A good developer should know one language each from a low-level procedural language such as C, object oriented languages such as C++ and Java, functional languages such as Haskell, F#, ML, and OCaml, scripting languages such as Python and Ruby, and a logic programming language such as Prolog.

- According to David Hsieh, who is a software developer; feedback and code review make a developer understand their mistakes and different ways to solve the problems. This consequently makes for a better developer.
- When Frank W. Zammetti, who is a lead architect and author of eight programming books, was asked on how to become a better developer, he said that making games is the best way to become a better developer. Developing games touch all the major topics such as algorithms, data structures, and optimised writing code. Coding games make use of audio and video coding, and input and output files. Thus, the developer becomes efficient in all these things. It also helps in learning debugging as well as programming skills. Coding for an error-free game makes a person proficient enough to be a better developer. The experience gained in developing so many games has increased his technical skills and made him a better developer. Therefore, one should practice making games in the technology or programming language of their choice to get the deep insights of programming and making one a better developer.
- According to Richard Eng, it is essential to learn programming languages, but that does not imply learning how to program. He says that the developer needs to focus on problem-solving, programming techniques, and analytical skills. She first suggests that developers should choose the simple language for coding, if possible.
- According to the UK based Software Developer, Andrew Magee, writing a clean code that is easy to read, reuse, and understand is a crucial characteristic of a better developer. He says that one function should have one purpose only. Making a more prominent function will make it hard to reuse.
- Pitaru says keeping learning and staying updated with new trends and implementing them to work, is one of the primary characteristics of a good developer. As new programming languages and methodologies keep on developing in the industry and adopting these is the key for a successful developer. **d**
