

- **Learn the basics first:** The internet is full of programming tips, articles, and forums. However, we recommend that you first go with more structured courses offered by the leading online learning portals, such as Udemy, Coursera, and others. Read all that you can about the programming language and the framework of your choice.
- **Study great websites and apps:** Take some time to explore great websites, apps, and try them to understand how they have built a great user experience by applying the right front-end development skills.
- **Know your tools:** A master knows their craft and toolset well; the same applies to front-end development skills. Take some time to understand the available tools and how to make the best of them. Sometimes, it's even wise to invest in paid ones to save time.
- **Practice:** Practice makes one perfect. Practice a LOT! Start from small applications and expand to complex use-cases.
- **Share the knowledge:** As you reach an expert level, participate in forums and programming communities to share your experience. There is nothing like the joy of sharing knowledge and growing further in the domain.
- **Ongoing learning:** Technology and the programming world are ever-changing. It is worth investing some time every week to keep up with industry trends, new tools, frameworks, and technologies. It is also worth spending some time to proactively learn new skills to maintain a leading edge in your career.

The Journey

Embark on your learning journey with the help of the below-mentioned information and learning resources.

1. Building blocks

HTML, CSS, and JavaScript are the building blocks of front-end development. Learning these will give you the right foundation before diving deep.

- **HTML:** Hypertext Markup Language (HTML) is used to create and format web pages. It provides code structures called tags and attributes to properly formatting the sections, headings, links, and paragraphs of the web pages/ applications.
- **CSS:** Cascading Style Sheet empowers you to enhance the look of your website by adjusting the font, layout, and colour of your content.
- **JavaScript:** JavaScript is a programming language used on both, the
