

reduce your learning curve and get you a great kick start. Please refer to the links provided in the last section.

● Online communities

Focusing on upscaling your skills is essential, but sometimes you may need advice from peers who may have faced similar challenges. While working on live projects, you would encounter some intricate issues, which could be challenging to crack and address on your own. There are several online forums such as Designer Hangout, Graphic Design Forums, Webdesignforums.net for front-end developers, where you can seek help, contribute knowledge, and learn a lot. Please refer to the links provided in the last section.

● Coding competitions

You may have heard of coding competitions like hackathons, but do you know why people participate in coding contests even when the prize money is insignificant? Coding competitions offer you a chance to assess your skills, get exposure to potential networking and employment opportunities, enhance your programming skills, and make you a better team player. We certainly recommend signing up for coding contests to boost your career, such as “code jam”, “hash code”, and “kick start” which are hosted by Google, and those hosted by HackerEarth as well. Please refer to the links provided in the last section.

Additional learning resources

We have compiled some useful online learning resources as well as tools for you to begin learning the technical skills. Good luck with your front-end development career.
