

designs web pages, and a back-end developer serves those web pages customised with user data.

To satisfy the above-mentioned description, a back-end developer needs to look into certain processes or responsibilities. Let us have a look at each of them:

Primary skills that are needed to be a good back-end developer

1. Managing, storing, and retrieving the data:

Back-end developers focus on the data that a particular site presents. Most web apps present various forms where users can enter data to create profiles, share stories, keep track of appointments, and so on. Back-end developers are responsible for storing this data and ensuring it's only presented to users who are supposed to have access to it.

2. Conducting payment-related requests securely:

Many websites require paid subscriptions to access them. Some back-end developers are responsible for accepting data on credit cards and other methods of payment, securely storing that information, and producing charges to that payment at the right time and for the right amount.

3. Handling Application Programming Interfaces (APIs):

These are basically the retrievers of the resources that are meant
