

1. **Algorithmic toolbox, Coursera:** This course covers basic programming techniques and theory that will help you to build efficient programs and apps. However, these skills are not directly used in the domain of back-end development, the tricks and theory are often used to assist the developers who make programs that undergo difficult tasks.
2. **Server-side development with NodeJS, Express, and MongoDB, Coursera:** Focussed on NodeJS, this course gives a complete package of back-end supported by MongoDB. It will help you launch your first project as a back-end developer. You can get more efficient or move into other platforms as well.
3. **Introduction to back-end, Udacity:** This course helps you learn the basics of back-end development, including taking input, managing data, etc. Starting right from the basics, this course will be a booster for people who know just the basics of coding and theory.
4. **W3School:** It is one of the most popular websites used by beginners to learn HTML. With interactive codes and precisely curated tutorial series, W3School remains one of the top choices for beginners.
5. **MySQL, Learning with Mosh:** A basic yet complete package of MySQL for beginners. A very enthusiastic instructor that helps you get started with SQL, covering basic commands, data types, and environment. The short notes provided in this tutorial are very handy during emergencies and interviews.

Top channels to get regular updates on back-end development
