

Introduction

Holding a full-stack developer tag means you are a jack-of-all-trades who provides high-end solutions using both front-end and back-end technologies. To achieve this tag, you have to learn a plethora of languages and tools. Let's thrive in today's generation by learning the following technologies to claim yourself as a jack-of-all-trades or a full-stack developer.

- Full-stack development with Spring Boot and React
- Full-stack development with Aurelia
- Full-stack development with JHipster
- Full-stack web development with Vue and ASP.NET
- Deploying your web applications
- Tutorials and courses

Full-stack development with Spring Boot and React

Spring Boot is a Java-based backend framework where you can develop a standalone web application with an embedded application server and React is a JS library for user interfaces. Here, you will learn the technical aspects of building modern and scalable full-stack applications using Java-based Spring Framework and React. Let's explore:

1. Java programming language

Java is a general-purpose, object-oriented programming language that is considered as the world's best application. It is fast, secure, and reliable. Java is free to access and is an independent programming language that can run on all platforms.
