

Styling tools

- **Bootstrap**

Bootstrap is one of the most popular frontend libraries that consist of HTML templates, CSS classes, and JavaScript files. The custom element and grid system feature of Bootstrap help to create a responsive website.

- **SASS**

SASS is a professional grade CSS extension language. With SASS, programmers can reuse CSS and can write maintainable style sheets.

Client-side framework

Angular and React are the two client-side frameworks supported in JHipster.

- **Angular**

Angular is a rewrite of the AngularJS framework, written in TypeScript. As libraries in Angular are modular, developers can choose what they need rather than the complete bundle. It also introduces advanced concepts such as Ahead of Time Compilation (AOT), lazy loading, and reactive programming.

- **React**

React is a JavaScript library for creating user interfaces, and it is not a complete MVVM framework. With the help of JSX, programmers can write React components. It only deals with rendering the UI, and it needs to integrate with other libraries to get similar functionalities as that of Angular. Some of the libraries are React Router, ReduxMobX, etc.

Client-side build tools

- **Webpack**

Webpack is a modular bundle where you can bundle your assets, scripts, images, and styles; it also provides a flexible plugin system. Some benefits include translation of TypeScript to JavaScript, optimised CSS and JS, compiled Sass, and so on. Webpack can reduce the bundle size, and uses a process called tree shaking that removes dead code.

- **BrowserSync**

BrowserSync is a synchronised browser testing tool. It synchronises the file changes and webpage interactions of different browsers. It can provide a productive development set up by integrating with Webpack/GulpJS.

Client-side testing tools

- **Karma**

Karma executes the test code to test real applications. It supports frame-
