

works such as Jasmine, Mocha, Quint, and can also integrate with integration tools.

- **Protractor**

It is an end-to-end testing framework for Angular that is also flexible with React, VueJs, etc.

2. Server-side technologies

Server-side framework

Let's go through the server-side frameworks such as Spring, Hibernate, and Liquibase.

- **Spring framework**

Spring framework is the best framework among Java developers. It combines Inversion of Control (IoC), Aspect-Oriented Programming (AoP), and technology abstraction in a consistent manner. Spring provides various applications such as SpringBoot, Spring Security, Spring MVC, and Spring Data.

- **Hibernate**

Hibernate is a powerful Java tool for object-relational mapping. It automatically generates SQL queries based on the database semantics. It uses Java annotations to map an object-oriented model to a relational database scheme and also implements the Java Persistence API (JPA).

- **Liquibase**

Liquibase is a database version control tool that can track and manage database schemes without interfering with SQL.

Server-side build tool

- **Maven**

Maven is a server-side build tool that uses the XML document. When it compares to Gradle, Maven is stable and more reliable.

- **Gradle**

Gradle is another build tool that uses GroovyDSL. It is more flexible and has more features compared to Maven.

Server-side testing tool

There are many server-side testing tools, which can be categorised based on unit testing, integration testing, performance testing, and behaviour testing. JHipster supports JUnit, Gatling, and Cucumber testing tools.

JUnit is an open-source testing tool mainly used for unit testing. When combined with the Spring Test framework, it can be used for Unit Testing
