## Full-stack web development with Vue and ASP.NET

In this section, we will look into the technical aspects of full-stack web development using Vue and ASP.NET Core.

### 1. Vue.js

Vue.js is a javascript framework for creating a user interface for web applications. It is incrementally adaptable, where you can integrate Vue into the existing portion of your application with a single CDN script reference. On the other side, you need supporting libraries and tools to build a complete Single-page Application (SPA).

### 2. ASP.NET

ASP.NET is a Microsoft ASP.NET web development framework. It is a lightweight, modular application that also supports cross-platform. The applications built on ASP.NET core use the middleware pipeline principle, i.e., an HTTP request that invokes a middleware function. This function provides the set of instructions to handle the HTTP request. You can also chain multiple middleware functions as a pipeline to process the HTTP request. Dependency Injection is one of the core techniques used in ASP.NET Core and many official libraries, such as EF Core (Entity Framework) and ASP.NET Identity, uses DI services.
