

learning can make a data scientist profile stand out from others and catch the employers' eye.

7) Data Visualisation

Data Visualisation consists of methods, tools, and techniques to present data graphically and bring visual insights. Especially in large and corporate organizations where constant discussions, meetings, and presentations are held, these charts, graphs, plots, etc., assist in rich insights and quicker decision-making.

Apart from these technical skills, data scientists' abilities to handle unstructured data can be a career-defining factor. An individual aspiring to become a data scientist must carefully choose the skills, duration, and learning curve to grasp the fundamentals for better scope and opportunities.

Non-technical Skills

These are the personal attributes or skills that must be acquired for a vibrant career in data science. You may not see these 'soft' skills written in a resume, yet, they complement the technical expertise to become a better data scientist.

- **Problem Solving**

Data science involves unseen structured and unstructured data problems. Here, the fundamental goal is to get valuable information from the data. Data scientists must evaluate the current procedures to value data or information to match with organisational goals. Data scientists must have the ability to understand the problem, measure the requirements efficiently, and then apply the tools and techniques that can solve the problem.

- **Teamwork**

Data science is not a one-person job. Data scientists work and combine their insights and ideas to multiple departments depending on the companies' needs and requirements. You can expect data scientists to work with almost everyone from the organisation.

- **Communication Skills**

Communication is one of the main aspects of the data scientist profession. He or she should be clear and fluent in order to implementing data-based decisions. Leveraging the effective use of insights and assisting in implementing changes from a technical perspective to non-technical departments such as sales or account departments.

- **Business Awareness/Acumen**

To be a better data scientist, individuals must possess a business awareness precise to their domain knowledge. Data scientists must have a thorough
