

upgrade and scale. As they say, beauty on the inside is synonymous with beauty on the outside.

In the course of your journey as an app developer, you may work with a cross-platform team, a web team, a strictly native team, or all three – and each one of you will be pushing your own agile trains, trying to meet the same deadlines! One thing to note about app-development is that absolutely nothing is standardized and every platform has its pros and cons. Give yourself the freedom to learn what your app aims to achieve, and not what you're comfortable working with. Start thinking of yourself as an "Android-first developer" instead of a pure "Android developer". The faster you get used to this fact, the better your progress will be.

While choosing app architecture, Native vs. Hybrid vs. Web is an age-old question, and to this day, there is no straight answer. The resources below give you a fair idea of how to choose your platform from a large developer perspective. We stick to our guns when we say that alternatives to native development are not at peak right now. The real reason why any platform gets chosen over the other has always been balancing the budget, time, and target market.

For iOS developers:

Choosing app architecture is doubly vital with iOS as Apple is fairly strict about the cleanliness of apps. The below resources give you a starting place to choose between MVX, VIPER, Clean and Composable architecture.

Commonly used design patterns for mobile apps
