

- Express Monkey – Stress-testing
- 21 – Fully SaaS AI test creator with an incredibly powerful feedback loop.
- Robotium – Free Android UI testing tool
- Kobiton – Centralized testing tool with manual as well as automated functionality
- Experitest – Execute hundreds of automated tests parallel on cloud Android devices. Integrated with CI/CD workflow

Practice makes perfect

There's no workaround to this. Whether you are Android or iOS, you need to be able to live and breathe development if you want to rise to the creamy layers. That said, when your coding skills are strong enough though, you can take up freelance work or participate in the competition (these tend to be fewer) to keep your creative juices flowing, while making money! So here is a list of places you can do just that.

Freelancing:

- Upwork
- Valuecoders
- Developerforhire
- Gun.io
- Good ol' startups around the block (Find them at angel.co)

Challenges and Competitions:

- Topcoder
- Programmr.com
- CodeProject.com
- Hackerearth

But that's not all. If you are not motivated by competition as much as you are by community, then immerse yourself in developer forums and communities and get active. Contribute to open-source projects as well. Make some great friends along the way, and you never know – you may just find the right clique to make the push towards entrepreneurship. Here's where you can get started (+GitHub).
