Deployment

One of the main reasons that really good apps fail to climb the ranks (and then burn out because of no investments on updates) is simply because they aren't marketed well. It can't be stressed enough how important getting your digital marketing strategies on point is, so that you don't see yourself dejected after all the hard work. Make sure you set aside a budget just for digital marketing during the planning phase itself. To help you do that here is the digital marketing essentials kit.

- A landing page: While you don't need a website, you will definitely need a good landing page, and there are several channels out there where you can make one for free.
- Social Media: Mashable, Insta, Facebook, Twitter, Behance and Dribbble. Make sure you're everywhere. And know how to push content on a regular basis, so that you get maximum visibility.
- Influencers and affiliates: Pitch to tech-blogs (like digit) to push your app
- PPC: Google, Facebook and Instagram offer great ad services. Set some money aside for this, just to gain initial momentum at the least.
- Make use of the community forums mentioned above. Pitch your apps regularly.
- Host a giveaway or freebies contest, to get noticed.

Alright, what next?

Now that you have a repository of information to scale-up your mobile app developer skill set, you can get moving and find your niche! But while you're doing that, keeping your eyes on the future is also essential. We started this conversation with AR/VR and we'll end it there. With forecasts indicating that the AR market is set to hit \$198 billion by 2025, you will get eaten by competition if you don't start this journey now. While Unity is the best in the biz as of now, there are some great free tools (like Google ARCore, Vuforia, Apple ARKit) you can equip yourself with by just spending some time of your present-day dedicated to your future days. Let the FOMO kick in! Happy developing.
