

for getting a product recommendation or searching for a nearby place. Thus, optimising your design for mobile screens is an essential factor.

3. **Composition and balance** – Visual balancing of the elements in the layout must be stable and also pleasing. The designer must give the right balance by placing both negative and positive aspects. Symmetrical, asymmetrical, radial, or mosaic, these aspects work together in conveying the message.
4. **Typography** – It is the science of writing. Choosing the right typeface or two or more typefaces that deliver the message with clarity, is an art that needs to be mastered. Even the scaling of the news needs to be perfect for a meaningful message.
5. **Contrast** - Build the focus of the audience by using the right combination of contrasts in the design.

It takes the right mixture of skills and nuances to understand the importance and weightage of each principle in the applied field. The designer has complete freedom in choosing their principles based on his interests. Your first design isn't the last one; create more designs by mixing all the principles in different proportions to understand what your design delivers to the audience.

Think like a designer!

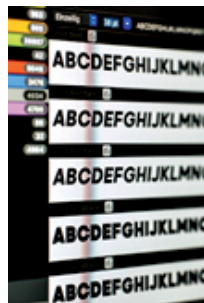

Design thinking is as important as the design itself.

Have the eye of the designer while preparing your layout. You are paving a journey for the user. You don't want the user to be lost somewhere in the middle of the trip. Place the right direction at the right place to keep them engaged. Follow these simple design rules before you start your layout:

1. **Discover** – Find what the user really needs! Discovering the user's motivation is the first phase where you need to observe and encourage the user to stay on the platform. Gather more ideas about what motivates your audience and use it in the further stages of developments.
