

2. **Define** – After gathering the motivation that keeps the user busy on the interface, write it down as a clear definition. You need to extract the core difficulties you are likely to face and formulate them as the problem statement that you need to be addressing. For instance, to make more sales on a website, place the buy now buttons in all the pages in an optimal manner. If you are experiencing more bounces at the checkout page, including a more precise and easy transaction process like UPI will reduce the bounce rate.
3. **Develop a prototype** – Your first design need not be your final one. Create prototypes and let them be reacted upon. Find out what others think and experiment with all the models. You can fine-tune your design based on popular opinions or the most liked ones. Trial and error is the best method to find out what your user likes!
4. **Test** – This is the stage where live testing such as AB testing happens. You show the same ad in two different designs and content to two different users to find out which one is preferred. This is like a temperature test for the product. It is not something to be looked at as a test; it is a phase where you can get real time feedback. Use them to fine-tune your designs further.
5. **Delivery** – Kudos! You have a good design ready to be delivered to your client—Pat yourself on the back for the excellent design you have created. Finalise, produce, and launch it! Mission accomplished.

Thinking like a designer

Smoothen out the rough edges!

Now, you are a designer who can create a design that keeps the user engaged, but to be a pro, you need to go that extra mile. Here are a few tips on being a pro UI designer:

1. **Be inspired** – There is nothing wrong with looking at other's designs. Connect with designers and look at what they are doing. It is a great way to learn by looking at others and getting inspired. You can get your ideas from top designers to choose variables such as :
 - a. Layout
 - b. Navigation
 - c. Typography
