

5. **Framer** – We suggest that you try Framer for creating interactive designs that are very realistic and real-time. This is a great interactive and prototyping application for creating UI designs.
6. **Flinto** – Yet another interactive prototyping tool for creating a layout for mobile, desktop, or Ipad. Collaborating and exporting a module or design from the Sketch app is easy using this application.

Few other applications that are recommended are :

1. Balsamiq is used in creating low-fidelity wireframing
2. Marvel App is the best for making interactive mockups.
3. UX pin is a browser-based application that is commonly used in creating an interface, prototyping and collaborating.
4. Mockplus Cloud is a product design tool with combined facilities of all the tools, as mentioned earlier.
5. Principle for Mac is a great tool to create animations which is also compatible with Sketch.

Teach and learn

Teaching is a two-way process. We get to learn as we teach others. It is a good practice to mentor other amateur designers in their naive projects. To gain knowledge from others, keep in touch with top designers to get mentored. Use the design forums constructively to get practical help anytime. Some of the recent techniques that you should learn are:

1. **Animated Illustration** – Animations are a trending way of informing the users about your brand. Tell the story with human touch using the moving images.
2. **Micro interaction**- Even a small icon that is animated may create a significant impact. Use highlighting or toggle animations to make interactions more engaging.
3. **3D Graphics**- Yet another great way of illustrating. Suppose you are in a high tech brand that needs illustrations to introduce the product, then 3D graphics are the best choice. Almost every big brand uses 3D graphics on their website.
