

performance by automating the workflow and sharing the work between each other.

DevOps, which is a set of practices and a progeny of agile software development to make operations and development engineers work together and improve their collaboration. DevOps includes 7 major practices that are:

1. Configuration Management
2. Persistent Integration
3. Infrastructure as a Code
4. Automated Testing
5. Continual Delivery
6. Continuous Deployment
7. Frequent Monitoring

All these practices are implemented by several different methods and tools. Having a good knowledge of implementing these practices is very much required. You can make a note of all the benefits of using these practices at <https://dgit.in/ddobbs> and we have mentioned all the effective tools and their benefits in the next part.

Implementing these practices can increase the frequency and velocity of code deployment. Moreover, we can also have codes that are production-ready. These codes have been tested on the production environment and
