

do not contain any errors and reduce the deployment time and also the maintenance required.

The DevOps engineer can belong to any domain, like being a software developer with an interest and knowledge of network operations or system administrators with good knowledge of development. All in all, a DevOps engineer has a role of integrating the development and collaborating with the development and the operations teams. This creates a chance for existing developers and system administrators to learn new skills and shift their career into DevOps.

How to get better at DevOps tasks.

In this section, we will know how to get better at DevOps engineer tasks.

DevOps engineers as we know can have so many tasks like managing the networks, taking care of the development, testing the codes and whatnot. Let us go through the checklist:

- Be a good system administrator - A system administrator's role is to create or build the servers, maintain them, and also troubleshoot them periodically. Things to keep in mind are:
 1. You have to ensure that the servers are running all the time.
 2. Make the deployment on servers and infrastructure an automated process.
 3. Always keep backup of your systems
 4. Documenting your work is very important
 5. Keep a track of all your log files
- Good knowledge of coding - A DevOps engineer is required to have a sound understanding of any one or more programming languages in order to perform the development tasks. You can follow these tips to maintain a good knowledge of programming all time:
 1. Take part in hackathons and also keep a regular practice of solving competitive programming questions
 2. Keep a check on recent developments of the programming language used by you or your organization.
 3. Keep a habit of doing unit testing
 4. Do lots of coding.
- Understanding the automation tools - As we discussed before, automation and its tools is a must. The steps that you should follow in order to get good at using these tools are listed in the latter part of the article.
