

- **Knowledge of Testing** - As a DevOps engineer, apart from the networking and development roles, the testing is also an integral part of the development process. Therefore, a good knowledge of testing can have you stand ahead from others. Keep these things in mind to improve your testing:
 1. Organizing the work is a must
 2. Ask questions to yourself before testing
 3. Make your priorities clear
 4. Increase the details of your reports
 5. Analyzing the data and thinking like the end-user will surely make a huge impact
 - **Security** - The security of a system is very important for the companies and maintaining it is one of the key tasks. Follow these tips to improve product security:
 1. Always keep your systems updated
 2. Frequently examining the software for all the security vulnerabilities is a must
 3. Develop prototype solutions for software security
 - **Deploy Virtualization** - A DevOps engineer has to work in both private and public cloud set-ups, and therefore they should be able to deploy the infrastructure easily. You should be proficient in virtualization as it is responsible for virtualizing the servers and all the other components.
 - **Good experience with network** - Network, and storage are an integral part of any production process, and a DevOps engineer has to be familiar with the network and storage concepts. A good understanding of network and storage will make it possible to develop robust applications that are scalable and also have high performance.
