Programming Languages for DevOps Engineers

Programming languages are very much required for DevOps and let us know the most used languages by DevOps engineers.

Programming Languages are very much necessary to become a software developer and also for a software job in general. There are a lot of programming languages used in the industry, but every programming language has a specific purpose. The programming languages that are used by DevOps engineers are:

- Python - Python is an all-purpose programming language and can be used for infrastructure too. It can be used to develop cloud infrastructures and can also be used to support web-applications.
- Ruby - Ruby is considered to be a high-level language and majorly used in infrastructure management. Ruby makes it possible for developers to manipulate the frameworks and controllers.
- JavaScript - Javascript is one of the integrated programming languages and is majorly used for website development, game development, mobile application development, and desktop application development.
