

2. Automatic Testing

Automation testing is the process of executing a test script to run a series of tests repeatedly to check the completeness of a software. It is done with the help of automation tools and saves both time and money. The robustness and reliability of automation tests depend on how well you have written your test cases.

So, when should you automate? Here are a few reasons that explain when you should go for automation.

- When you are running on a fixed clock and do not have enough time to evaluate the software using manual testing.
- Business-critical projects that require testing the same component frequently.
- When your requirements are not modifying frequently.
- When you need to perform load and performance testing of software.

What are the methods of software testing?

1. White-box Testing

Glass testing, structural testing, clear box testing, and open-box testing are some of the other names of white-box testing. As the name suggests,
