tester should keep himself/herself updated with the latest technology and tools built on the respective technology. A tester should also be familiar with different types of databases such as Oracle, MySQL, MongoDB as the tester needs to interact with large volumes of data stored in one of these databases.

- **Communication Skills:** A tester should have excellent written and verbal communication skills as he/she needs to prepare several artefacts based on the tests performed. All these artefacts should be easy to understand.

Conclusion

Software testing is considered the most important part of the software development process. More than 45% of the time and effort by developers is spent in testing the software or application. Software testing ensures that the software is reliable, intuitive, secure, and performs well under abnormal conditions or pressures when hundreds of users access the software at the same time. As an upcoming developer, it is important to understand software testing. Hopefully, this article helped you understand the basics of software testing, its types, and its importance. **d**
